

TestFairy Makes Mobile App Testing Painless!

When testing mobile apps in the crowd, in house or with paid testers, you never know what exactly was tested and what exactly went wrong on the client side.

TestFairy solves this problem by providing a video that shows everything that happened on the mobile device, including detailed internal metrics such as CPU,

memory, GPS, logs, and crash reports as well as detecting ANRs and alerting when exactly apps behave abnormally.

| App Distribution

Send your testers a fully customized email invitation, or get even more testers by using our auto-generated landing pages!

Testers can browse different apps, versions, release notes and report bugs straight from our Testers App (optional).

Integrate directly with Jenkins / Gradle, or write your own plugin with our open API.

| Analytics

The TestFairy platform provides you with a **full video** of the app's usage, along with monitoring app behavior such as **memory, cpu, wifi and phone reception**.

This allows you to see how your users use your apps and understand what happened before a crash or before an issue has been reported.

| Crash Reports

TestFairy catches any **crash** and posts it directly to your bug system together with a video that shows exactly what happened right before the crash.

By answering all questions in advance and by providing videos and logs, TestFairy helps developers save time and fix bugs faster.

| User Feedback

TestFairy makes **bug reporting** easy. Testers can submit bug reports from within the app by shaking their phone, by logging into their *my.testfairy.com* or by using the TestFairy native Testers App.

Feedbacks are sent to you by mail, posted directly to a bug system of your choice or pushed via webhooks!

TestFairy is here to help you you fix bugs faster.

By providing developers with better information, and posting this information to the right place, TestFairy helps companies bring better products to the market, faster than ever.

Try it, you will never look back.

Integrations

JIRA	Jenkins	Xamarin
Github	Gradle	Adobe Air
Slack	Travis-CI	PhoneGap
Trello	Open API	Unity
